

Set up fleet conversion on your PC

This gets the kit onto a new Windows machine. It does not convert a site. Hover a pin for the annotation.

INTERACTIVE ANATOMY

Why each setup step earns its place

Choose an analysis mode. Hover a pin, timeline row, or note for an instant callout. Click to keep it open.

What to do

Secrets

Don't do this

Page structure		01 / 12
01	Not a convert	LOCK
02	Five folders	KIT
03	Prerequisites	TOOLS
04	Copy the kit	UNZIP
05	Recreate links	JUNCTION
06	Create .env	TOKEN
07	Constants	LANE
08	Prove it works	PROVE
09	Run jobs	OPS
10	Then convert SOP	READ
11	Don't do these	GUARD
12	Setup checklist	SHIP

MODE NOTESHOVER FOR ANNOTATION · CLICK TO PIN

01 Setup first, convert later

This page only gets the kit onto a PC. Path A / B / C live in the convert SOP.

Order

02 Links, not copies

fleet\worker opens shared-apex-static. If the junction breaks, scripts look empty.

Hub

05 Junctions rarely survive zip

Empty fleet\worker after unzip is expected. Recreate links before you panic.

Repair

06 Three .env files

Worker, preview, and conversion each need the vault token. fleet\ itself has none.

Per project

10 First job is preview-only

One non-critical domain on static.* until the convert SOP is clear.

First job

Live: sop-machine-setup.michael-215.workers.dev · PDF: [SOP-MACHINE-SETUP.pdf](#)

fleet SOP · unzip kit · recreate junctions · vault token · prove APIs

01 · THIS SOP DOES NOT CONVERT A SITE

01

Get the kit onto a new Windows PC. Then open the convert SOP.

GitHub is not required. Never put .env in git, zip, Slack, or chat. Token comes from the vault only.

Copy folders

Recreate links

Prove it works

Printable PDF

Same content as this page, for offline / print. After setup, follow Path A / B / C in the convert SOP.

[Download SOP-MACHINE-SETUP.pdf](#)

02 • WHAT LIVES WHERE

02

Unzip so these five folders sit next to each other under Downloads.

Inside `fleet\`, `worker` / `preview` / `conversion` / `handoff` are links to the real folders, not copies of the code. Do not put a `.env` in `fleet\` — each project has its own.

```
C:\Users\<You>\Downloads\  
  fleet\                Hub: SOPs, audits, CSVs, form JS. Run from here.  
  shared-apex-static\   Fleet Worker, KV/R2 scrape  
  fleet-static-preview\ static.* preview, DNS, apex cutover  
  static-conversion\    Per-site convert + 26-check audit  
  static-fleet-handoff\ Team SOP copies
```

LINK IN FLEET\	REAL FOLDER
worker\	..\shared-apex-static\
preview\	..\fleet-static-preview\
conversion\	..\static-conversion\
handoff\	..\static-fleet-handoff\

03 • PREREQUISITES

03

Windows, PowerShell, curl, Python, and a vault token. No GitHub, no Node.

TOOL	REQUIRED?	NOTES
Windows 10/11	Yes	
PowerShell 5.1+	Yes	Built-in

TOOL	REQUIRED?	NOTES
curl.exe	Yes	Built-in on current Windows
Python 3.x	Yes	26-check / Form QA (requests, openpyxl)
Cloudflare API token	Yes	From the vault. Never Slack, email, or git
Git / GitHub	No	Zip or shared drive
Node / Wrangler	No	Operators use PowerShell + the API token

COMMAND • CHECK TOOLS

```
Set-ExecutionPolicy -Scope CurrentUser RemoteSigned
python --version
curl.exe --version
python -m pip install requests openpyxl urllib3
```

04 • COPY THE KIT

04

Ask the lead for the zip with no .env files, plus the vault item.

1. The zip / shared-drive copy of the five folders (**no .env files**).
2. Vault item for CLOUDFLARE_API_TOKEN (and DevSecSi key only if you will run old per-site convert).
3. Confirmation that shared-apex-static\reports\fleet-infra.json is in the zip.

Unzip under C:\Users\<You>\Downloads\ so the folder names match this SOP. Do not nest Downloads\fleet\fleet\. If fleet\worker is empty after unzip, the junction did not survive — recreate links in the next step.

05 • RECREATE THE FLEET LINKS

05

Open PowerShell in fleet. This does not need Run as administrator.

Check: `dir worker` should show README.md and scripts\ from shared-apex-static, not an empty directory. If you skip the links, run the same scripts from the real folders.

COMMAND • JUNCTIONS

```
cd "C:\Users\<You>\Downloads\fleet"
```

```
foreach ($pair in @(
    @{ Name = 'worker';      Target = '..\shared-apex-static' },
    @{ Name = 'preview';     Target = '..\fleet-static-preview' },
    @{ Name = 'conversion';  Target = '..\static-conversion' },
    @{ Name = 'handoff';     Target = '..\static-fleet-handoff' }
)) {
    if (Test-Path -LiteralPath $pair.Name) { cmd /c "rmdir `"$($pair.Name)`" " }
    New-Item -ItemType Junction -Path $pair.Name -Target (Resolve-Path
$pair.Target) | Out-Null
    Write-Output ("OK {0} -> {1}" -f $pair.Name, (Resolve-Path $pair.Target))
}
```

06 • CREATE .ENV IN EACH PROJECT

06

Paste the vault token into worker, preview, and conversion. Leave the rest as in .env.example.

Token needs: Workers Scripts, KV, R2, Zone DNS (read), Zone Workers Routes, Zone Cache Purge, Zone WAF. Same Cloudflare account the live fleet already uses. Fleet infra is already live — do not re-provision unless reports\fleet-infra.json is missing.

A • SHARED-APEX-STATIC (FLEET\WORKER)

```
cd "C:\Users\<You>\Downloads\shared-apex-static"
Copy-Item .env.example .env
notepad .env
```

B • FLEET-STATIC-PREVIEW (FLEET\PREVIEW)

```
cd "C:\Users\<You>\Downloads\fleet-static-preview"
Copy-Item .env.example .env
```

Paste the same token. Add Server 1 origin if missing: HOSTING_IP_S1=165.140.157.43.

C • STATIC-CONVERSION (FLEET\CONVERSION)

```
cd "C:\Users\<You>\Downloads\static-conversion"
Copy-Item .env.example .env
.\Invoke-TestApis.ps1
```

Fill DevSecSi only if you will call Adam's provision API. Fleet preview / cutover / origin-IP rescrape do not need it. If TestApis fails, stop and fix the token with the lead.

07 • CONSTANTS

07

Two origin IPs, two Workers, one skip domain.

Do not move Batches 1–7 live apex onto fleet-static-worker-server-1. Stay-WordPress is Azalea Park only — Round Rock, Savannah, and Lake Worth convert like everyone else.

NAME	VALUE
Server 2 origin (Batches 1–7 live apex)	174.136.29.214 → fleet-static-worker
Server 1 origin (new batches)	165.140.157.43 → fleet-static-worker-server-1
Shared KV / R2	HTML_FLEET / fleet-static-assets
Form JS (fleet inject)	C:\Users\<You>\Downloads\fleet\assets\form-validation.js
Stay-WordPress (never convert)	azaleaparkfoundationrepair.com

08 • PROVE THE MACHINE WORKS

08

All Test-Path checks True. Cloudflare probe returns True. Token is never printed.

FROM DOWNLOADS\FLEET

```
Test-Path .\worker\.env
Test-Path .\preview\.env
Test-Path .\conversion\.env
Test-Path .\worker\reports\fleet-infra.json
Test-Path .\assets\form-validation.js
Test-Path .\SOP-CONVERT-PREVIEW-CUTOVER-RESCRAPE.html
```

CLOUDFLARE TOKEN (DOES NOT PRINT THE SECRET)

```
cd "C:\Users\<You>\Downloads\shared-apex-static"
$tok = (Get-Content .env | Where-Object { $_ -match '^CLOUDFLARE_API_TOKEN=' }) -
replace '^CLOUDFLARE_API_TOKEN=', ''
$h = @{ Authorization = "Bearer $tok" }
(Invoke-RestMethod -Uri
"https://api.cloudflare.com/client/v4/accounts/f215f8ca79dd9d53b04618556593a581/wor
static-worker" -Headers $h).success
```

Always start in Downloads\fleet. Domain lists go in fleet\sites\.

Full steps, origin-IP rules, and cutover flags are in the convert SOP — not here. Copy finished spreadsheets into fleet\audits\.

EXAMPLES

```
cd "C:\Users\<You>\Downloads\fleet\preview"
powershell -ExecutionPolicy Bypass -File .\scripts\Invoke-
PreviewStaticOnFleet.ps1 `
    -SitesCsv .\sites\YOUR.csv -OriginIp 174.136.29.214 -WorkerName fleet-static-
worker

cd "C:\Users\<You>\Downloads\fleet\worker"
powershell -ExecutionPolicy Bypass -File .\scripts\Invoke-WpOriginToFleet.ps1 `
    -SitesCsv .\reports\YOUR.csv -HostingIp 174.136.29.214 -SkipRoutes -SkipAssets
```

Do not convert or cut over apex until Path A / B / C is clear.

First real job: one non-critical domain, static.* only. Apex cutover requires - IConfirmApexCutover.

- ▶ Path A — new convert → static.* → apex
- ▶ Path B — rescrape via hosting IP
- ▶ Path C — rollback to WordPress, edit, rescrape
- ▶ Form-validation inject after every HTML scrape
- ▶ Stay-WordPress = Azalea Park only

Live convert SOP: sop-convert-preview-cutover-rescrape.michael-215.workers.dev

The token never leaves the vault. Fleet infra is already live.

DON'T	WHY
Commit or zip .env	Token in git / shared drive
Paste the token into chat	Vault only
Re-provision fleet "to be safe"	Infra is already live; you can overwrite routes
Skip Stay-WordPress	Never convert Azalea Park
Scrape public HTTPS on a live fleet site	Recopies stale KV
Use Downloads\form-validation.js	Missing popup listeners; use fleet\assets\
Omit workerName on a new-batch Adam scrape	Lands static.* on Server 2
Cut over apex without -IConfirmApexCutover	Script will refuse; that is intentional

12 • SETUP CHECKLIST

12

Tick these before your first real job

- ▶ Five folders under Downloads\ with the names in section 02
- ▶ fleet\worker, preview, conversion, handoff point at the real projects
- ▶ .env in worker, preview, conversion — token from vault
- ▶ python -version and curl.exe -version work
- ▶ Invoke-TestApis.ps1 green if you will use conversion
- ▶ Cloudflare Workers script probe returns True
- ▶ fleet-infra.json and fleet\assets\form-validation.js exist
- ▶ Convert SOP opens (HTML live URL or fleet HTML/PDF)
- ▶ No .env in the zip you send the next person
